

FLUSHING AGENT

When used prior to a fluid change, our TFS Flushing Agent is added to the body of the old fluid, as a small percentage removes the insoluble gums, sludge and varnish that can result from the mineral oil oxidation process and cause reduced performance in heat transfer systems. Fast acting, it restores cleanliness and thermal stability for maximum system efficiency.

PERFORMANCE BENEFITS

- High Flash Point (110°C) compared with many solvent cleaners
- Low Pour Point of -33°C
- Exceptional Solvent Power - for gums and varnishes
- Ease of Application – no loss of production time
- Dissolves small amounts of water – less than 1%
